More particularly, the invention relates to a buffing machine that is capable of incorporating various brush holding devices, as well as other features. The prior art has shown numerous devices for driving, holding and advancing bristles in cloth or buffing wheels. However, none of the prior art devices include a combination of features that achieve the results of this invention. Thus, the present invention achieves a new and novel design. The present invention includes a motor, which drives a ball-type bearing. The bearing is positioned within a housing to an enclosed space and pressurized with an air or other fluid. The output shaft of the motor is enclosed in a shroud that houses an end plate with drive teeth thereon. The enclosed space between the output shaft and the end plate provides room for an abrasive brush and a bristle container. The bristles are secured between the end plate and a base. The base is preferably secured to the motor shaft. The base creates a tube-like internal chamber that is pressurized by the air or fluid supplied to the housing. The bristles move back and forth within the tube-like chamber. A sheath or sheath-like member is formed on the bristles such that the bristles engage the buffing wheel upon actuation of the bristle tube and motor. c6a93da74d
